Chapter 4 – Threads, SMP, and Microkernels

True / False Questions:

- The basic unit of dispatching in an operating system is usually referred to as a thread or lightweight process.
- 2. An example of a system that implements a single process with multiple threads is MS-DOS.
- 3. In a multithreaded environment, a process is defined as the unit of resource allocation and a unit of protection.
- 4. The concept of thread synchronization is required in multithreaded systems because threads of a single process share the process's process control block (PCB).
- 5. In a pure User-Level Thread (ULT) facility, all of the work of thread management is done by the application, but the kernel is aware of the existence of threads.
- 6. In the field of distributed operating system design, the One-to-Many (Thread-to-Process) relationship is particularly interesting because it involves the concept of thread migration.
- 7. One disadvantage to the master/slave shared-memory multiprocessor architecture is that the failure of the master brings down the whole system.
- 8. In a symmetric multiprocessing (SMP) system, each processor has access only to a private main memory area.
- 9. An SMP O/S manages processor and other resources so that the user may view the system in the same fashion as a multiprogramming uniprocessor system.
- 10. The primary advantage of the basic microkernel design over layered kernel designs involves increased performance.
- 11. The philosophy underlying the microkernel is that only absolutely essential core operating system functions should be in the kernel.
- 12. The basic form of communication between processes or threads in a microkernel O/S is messages.
- 13. Linux makes no distinction between a process and a thread.
- 14. Windows 2000 is an object-oriented O/S, but only processes (not threads) are implemented as objects in the WIN2K O/S.
- 15. In the Solaris O/S, a User-Level Thread (ULT) in the active state is assigned to a Light-Weight Process (LWP) and executes while the underlying kernel thread executes.

Multiple Choice Questions:

- The concept of a process in an operating system embodies two primary characteristics, one of which is:
 - a. Multithreading
 - b. Resource ownership
 - c. Symmetric multiprocessing
 - d. None of the above
- 2. An example of a system that implements a single process with multiple threads is:
 - a. WIN 2000
 - b. Solaris

- c. Java
- d. All of the above
- 3. Which of the following is true regarding the relationship between processes and threads:
 - a. It takes far less time to create a new thread in an existing process than to create a new process
 - b. It takes less time to terminate a process than a thread
 - It takes less time to switch between two different processes than to switch between two threads within the same process
 - d. All of the above
- 4. The basic thread operation related to the change in thread state that occurs when a thread needs to wait for an event is referred to as the:
 - a. Unblock operation
 - b. Spawn operation
 - c. Block operation
 - d. None of the above
- 5. One of the disadvantages of User-Level Threads (ULTs) compared to Kernel-Level Threads (KLTs) is:
 - a. Scheduling is application specific
 - b. When a ULT executes a system call, all threads in the process are blocked
 - c. Thread switching does not require kernel mode privileges
 - d. All of the above
- 6. In the Linux O/S, multiple threads may be created and executed within a single process. This is an example of the following Thread-to-Process relationship:
 - a. 1:1
 - b. 1:M
 - c. M:N
 - d. None of the above
- 7. The computer system category where a single processor executes a single instruction stream to operate on data stored in a single memory is called:
 - a. Single Instruction Single Data (SISD) stream
 - b. Single Instruction Multiple Data (SIMD) stream
 - c. Multiple Instruction Single Data (MISD) stream
 - d. None of the above
- 8. In a SMP system, each processor maintains a local cache and must alert all other processors that a change to cache update has taken place. This is referred to as the:
 - a. Interconnection mechanism problem
 - b. Synchronization mechanism problem
 - c. Cache coherency problem
 - d. None of the above
- 9. Key issues involved in the design of multiprocessor operating systems include:
 - a. Scheduling
 - b. Synchronization
 - c. Reliability and fault tolerance

- d. All of the above
- 10. Early operating systems that were designed with little concern about structure are typically referred to as:
 - a. Monolithic operating systems
 - b. Layered operating systems
 - c. Kernel operating systems
 - d. All of the above
- 11. A benefit of the microkernel organization is:
 - a. Extensibility
 - b. Portability
 - c. Flexibility
 - d. All of the above
- 12. In low-level microkernel memory management, an example of an operation that can support external paging and virtual memory management is the:
 - a. Grant operation
 - b. Map operation
 - c. Flush operation
 - d. All of the above
- 13. In a W2K system, the state that a thread enters when it has been unblocked and the resource for which it has been blocked is not yet available is called the:
 - a. Transition state
 - b. Waiting state
 - c. Standby state
 - d. None of the above
- 14. In a Solaris system, a User-Level Thread (ULT) that enters the active state is assigned to a:
 - a. Kernel thread
 - b. Heavy-Weight Process (HWP)
 - c. Light-Weight Process (LWP)
 - d. None of the above
- 15. In a Linux system, when a new process is cloned, the two processes share the same:
 - a. Process identifier
 - b. Virtual memory
 - c. task struct data structure
 - d. All of the above

Fill-In-The-Blank Questions:

1.	In an operating system, the unit of dispatching is usually referred to as a
	, while the unit of resource ownership is usually referre
	to as a process or task.
2.	An example of an operating system that supports a single user process and a
	single thread is
3.	An example of an operating system that supports multiple user processes and
	multiple threads is

4.	It is necessary to	the activities of various threads so they
	do not interfere with each other or corrupt	data structures.
5.	A process that cannot execute until some state.	event occurs is said to be in the
6	The Clouds O/S implements the concept	of a throad ac primarily an aptity that
0.	can move among address spaces which r	
	·	epresents the Thread-to-
7	Process relationship.	al can avecute an any processor and
1.		el can execute on any processor, and
	typically each processor does self-schedu	ling from the pool of available
_	processes or threads.	
8.	In most modern computer systems, proce	
_	of that is private to	·
9.	With multiple active processes in an SMP	•
